Attention: [REDACTED]

Dear Ed:

25X1A [REDACTED] has indicated that he loses some time when going dark in loading and unloading the B camera because it takes time for the eyes to become dark adapted. I sent him two pair of dark adaptor goggles to try. He recently reported that they were a time saver and requested more.

I am mailing you three pair for trial. If you can get your people to wear them ten minutes or longer (depends on the man) in the white light before going dark you will find that they eyes will be in good condition for seeing under low levels of green light when you drop the goggles off in the dark. Conversely if you have to go light for a few minutes you can retain dark adaptability by putting on the goggles first.

A description follows:

Polaroid No. 1084 Dark Adaptor Glasses made by H. L. Bouton Company, 1 Main Street, Buzzards Bay, Massachusetts. Cost \$4.50 each.

Yours very truly

25X1A [REDACTED]
